

Technology Stack

Date	1 October 2026
Team ID	SWTID-2026-3594
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Define Your Technology Stack:

Identify the programming languages, frameworks, databases, front-end tools, back-end tools, and APIs that you will use to build your solution. A well-chosen technology stack ensures that your application is scalable, maintainable, and aligned with your project requirements.

Fill out the table below to detail the specific technologies chosen for each component of your architecture and provide a brief justification for your choice.

Technology Stack Details

S.No	Architecture Component / Layer	Technology Chosen	Justification / Purpose
1	Frontend / Client-Side (e.g., React, Angular, HTML/CSS)	ServiceNow Platform UI (List and Form views, Application Navigator)	Ready-made responsive UI; no custom frontend needed, and list/form views show ACL results directly.
2	Backend / Server-Side (e.g., Node.js, Python/Django, Java)	ServiceNow server-side JavaScript (Glide APIs such as gs.hasRole)	ACL scripts run on the server, so access rules cannot be bypassed from the browser.
3	Database / Data Storage (e.g., MySQL, MongoDB, PostgreSQL)	ServiceNow platform database with the custom table u_institution_details	Tables and fields are created from the UI; reference fields link records to users.
4	Cloud / Hosting / Deployment (e.g., AWS, Azure, Heroku, Docker)	ServiceNow Personal Developer Instance (PDI)	Free cloud-hosted instance with admin access, ideal for building and testing ACLs.
5	Version Control & CI/CD (e.g., GitHub, GitLab, Jenkins)	Update Sets (to move configuration) and GitHub (documentation)	Update Sets capture ACLs, roles and tables; GitHub keeps the team's project documents together.
